

DEVELOPERS LIVE

# Rapid Frontend Development: your future workflow

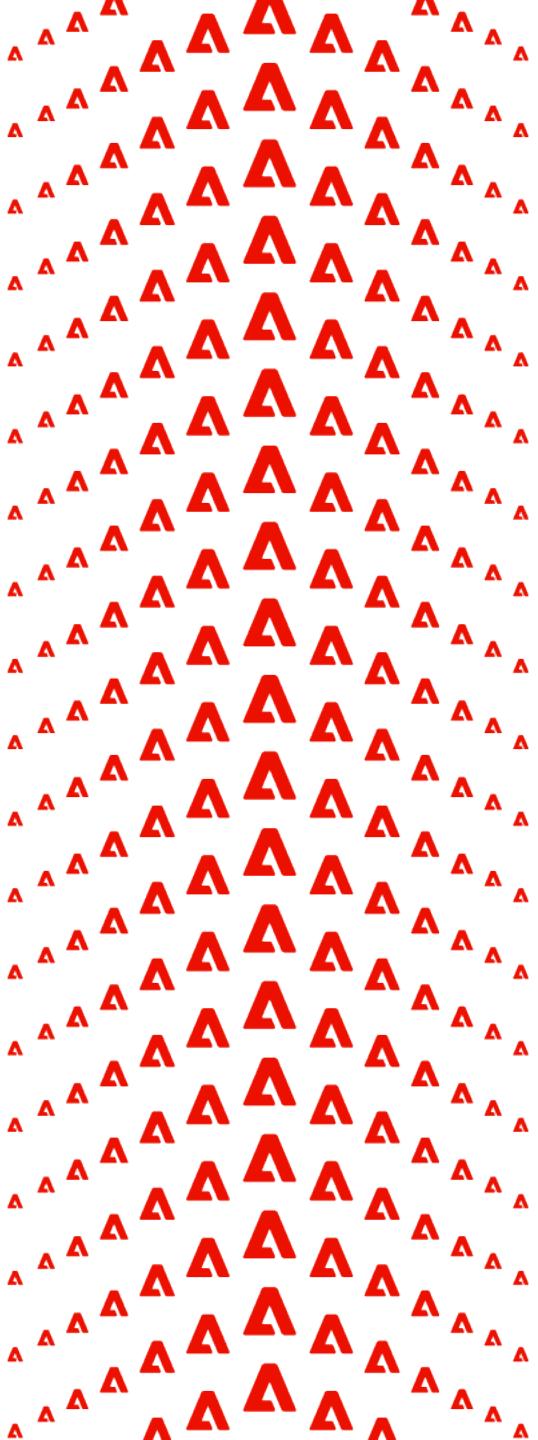

Gabriel Walt | AEM Sites Product Management

# Rapid Frontend Development

Agenda:

- Current state
- Future workflow
- Demo
- Technical details
- Win a \$1000

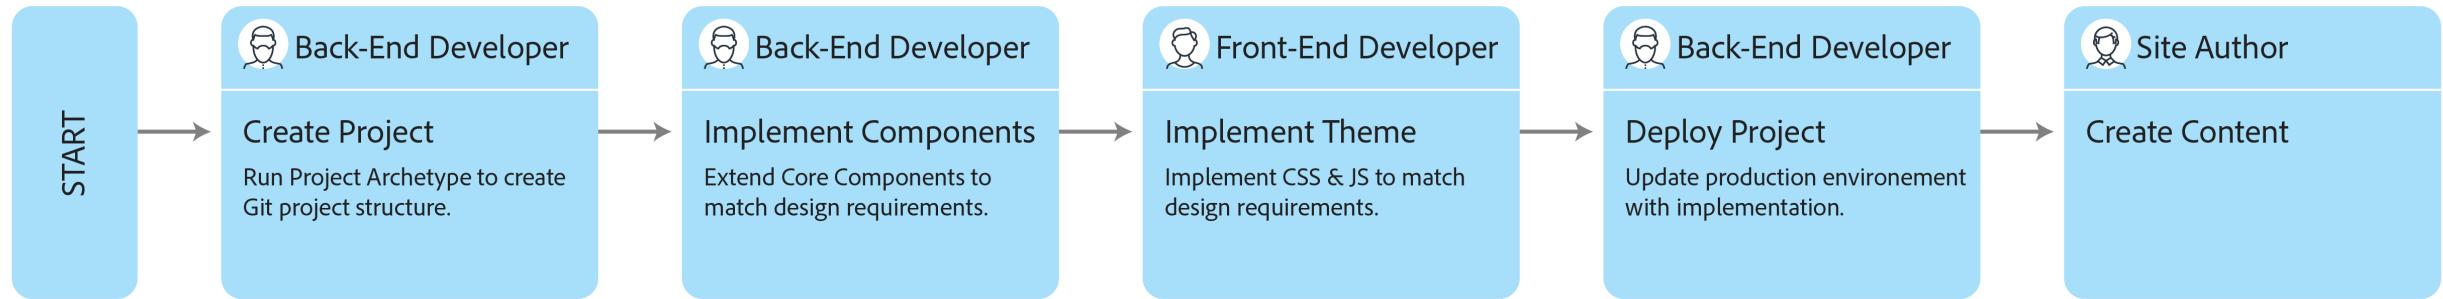

# Site Creation Features

Like pieces of a puzzle:

1. HTML Template Language
2. Java Sling Models
3. Core Components
4. Template Editor
5. Style System
6. Grid System
7. Content & Experience Fragments
8. Project Archetype

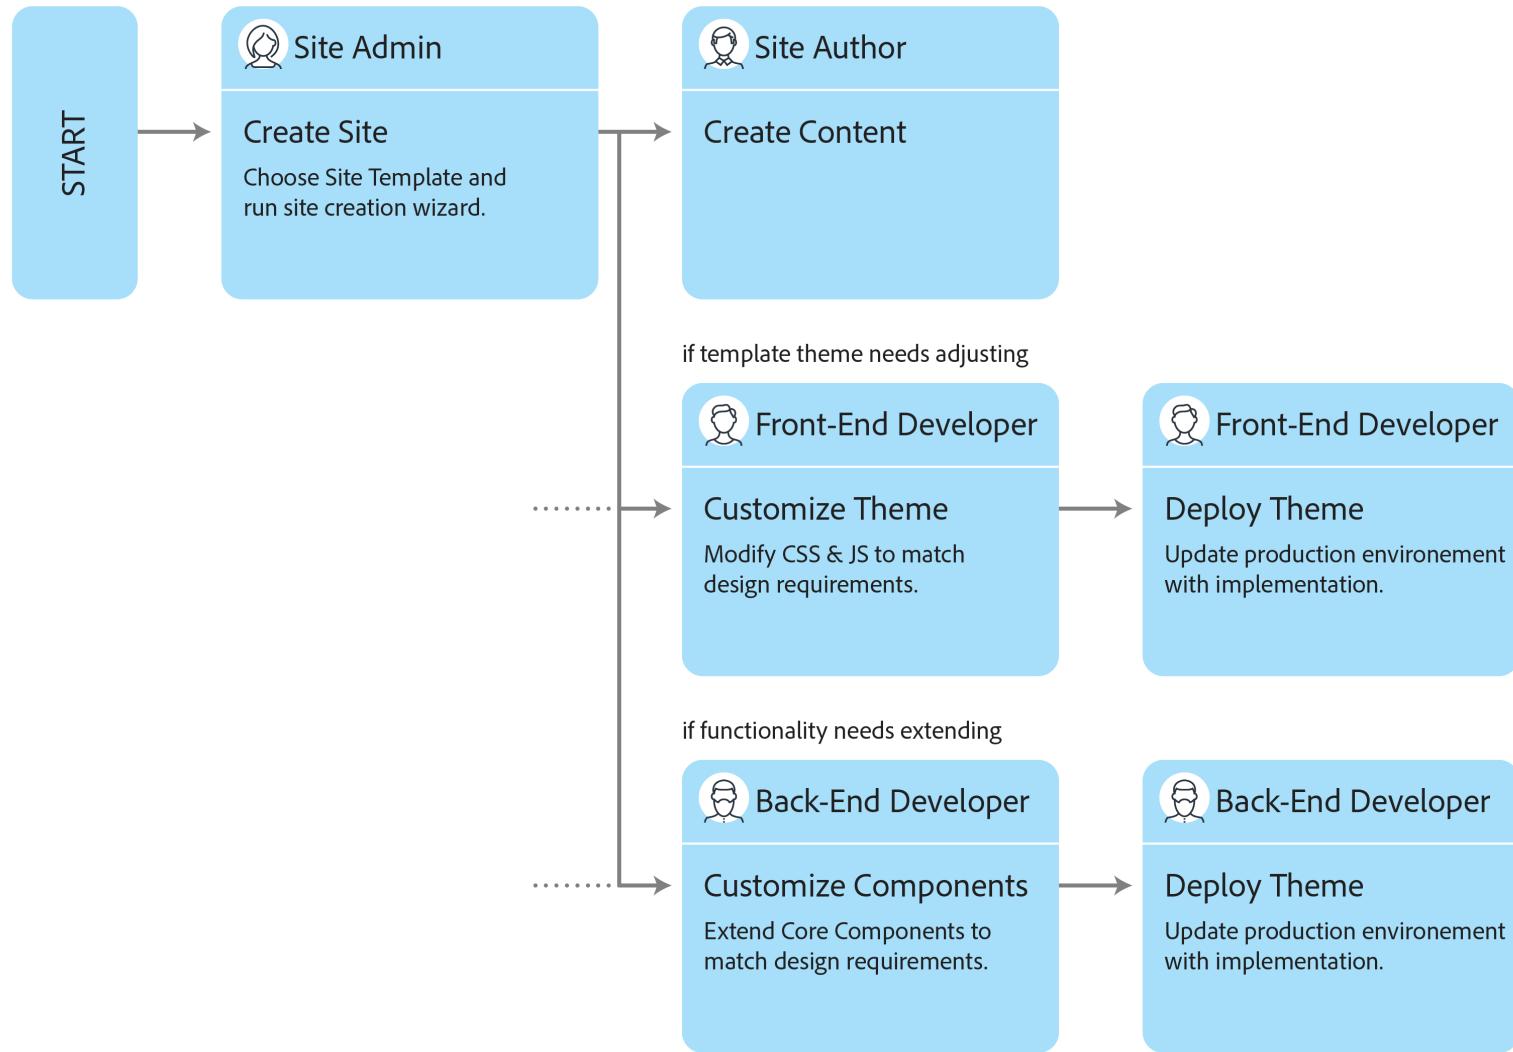

# Traditional Site Creation

- A back-end centric process.
- Front-end developers heavily depend on back-end developers.
- Authors cannot start before the entire process got completed.
- Forces projects into a waterfall model.

# Rapid Site Creation

## Introducing new concepts

- Site Template
- Site Creation Wizard
- Front-End Module
- Front-End Deployment

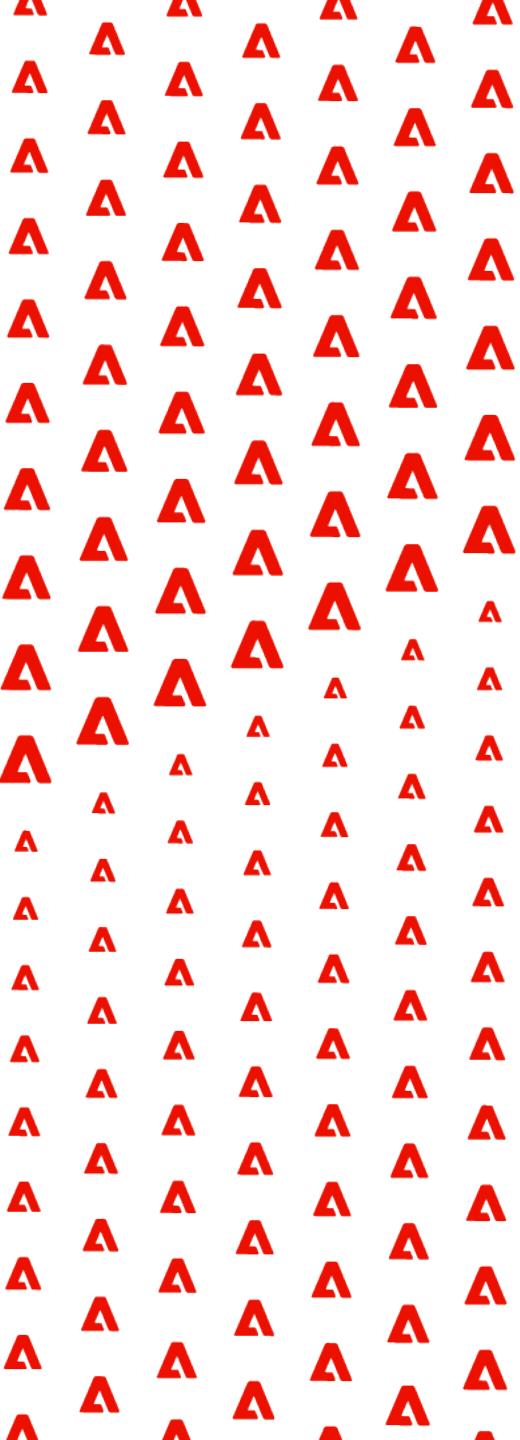

# Availability

- The feature is currently in private beta.
- Generally availability is currently estimated for later 2021.
- If interested in early access, please reach out.

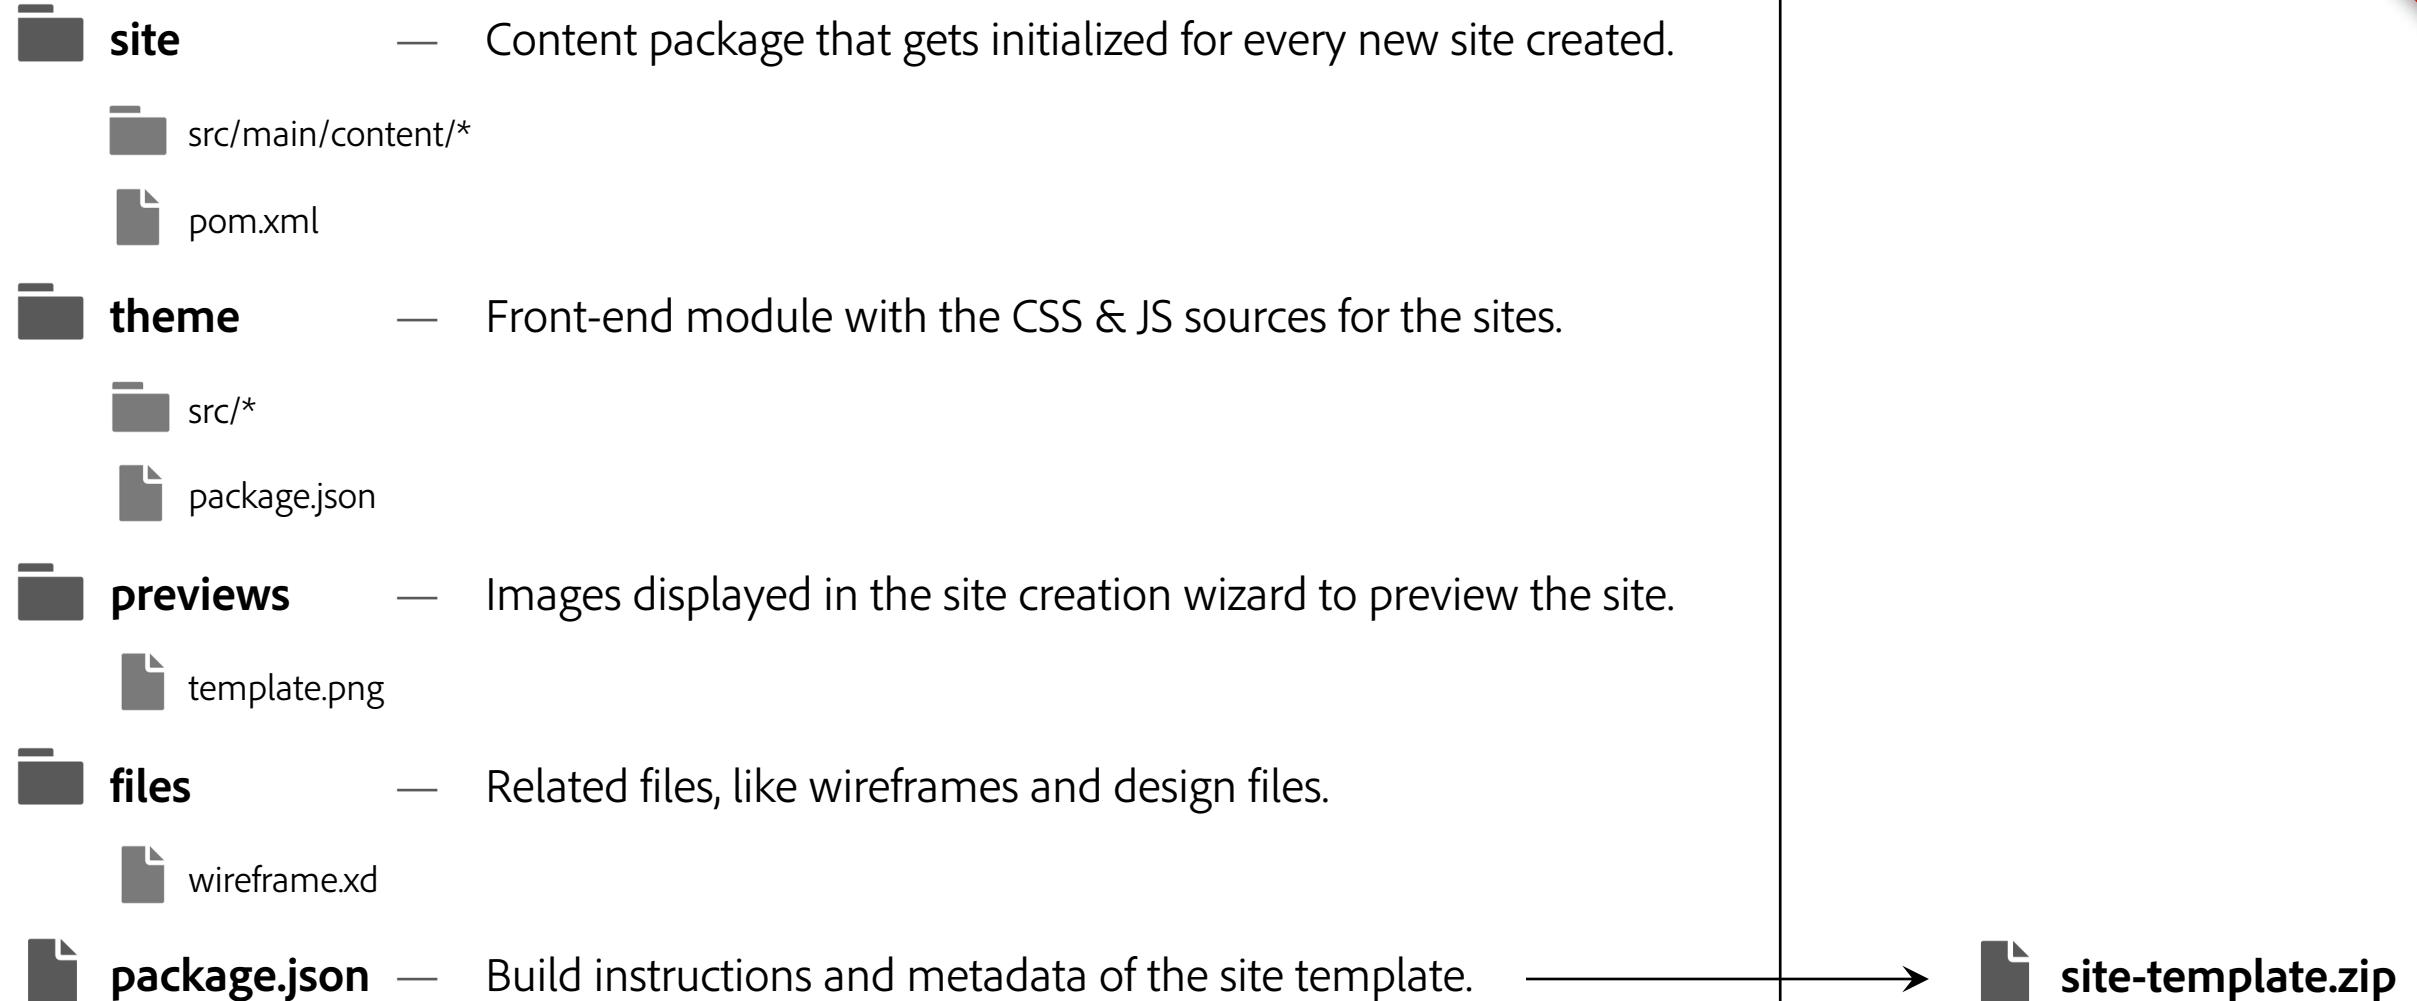

# Sneak Peek

# Demo

# Site Template

# Site Creation Wizard

The admin:

- chooses or upload a site template;
- configures the site title and name.

As a result, the site creation wizard:

- initializes a site from the content package of the site template;
- applies the theme (CSS & JS) of the site template to the created site.

# Front-End Module

- Is a standard NPM project.
- Requires no Java tooling (such as Maven).
- Allows for any NPM tooling (like Webpack or Sass).
- Builds static files that will be deployed as-is.
- Won't wrap the files into an AEM Client Library.

# Front-End Deployment

- Deploys the built files to location that is publicly available via the Cloud Service CDN.
- Deploys the files a time-stamped path to efficiently kill caches.
- Informs Experience Manager about deployments for it to update its file references.
- The core page component references the deployed files via a central context-aware config.

# Important to know

- A site template can only deploy mutable content such as:
  - `/content/SITENAME/*`
  - `/content/dam/SITENAME/*`
  - `/content/experience-fragments/SITENAME/*`
  - `/conf/SITENAME/*`
- If a site template relies on custom code, this needs to be deployed by a back-end developer before the admin can use the site template.
- For the time being, prior to go-live, a back-end developer still needs to deploy the Dispatcher configuration.

# Show us your best site template – you may win \$1000!

## Create Your Own Site Template Contest

Get early access to new Adobe Experience Manager Sites functionality that will accelerate your implementation projects!

**Your Challenge:** Create your own full site template – which includes both the component and page template designs of your site as well as the accompanying front-end code – by leveraging beta features being released later this year. Top 3 entries win a \$1000 gift card, and top winner overall will be selected as a finalist for our AEM Rockstar challenge.

Visit [here](#) for more on contest rules, guidelines, and eligibility.

DEADLINE: March 19, 2021
